

# Component Development Assignment

Develop the comment component so that it matches the look and file structure shown in the image.

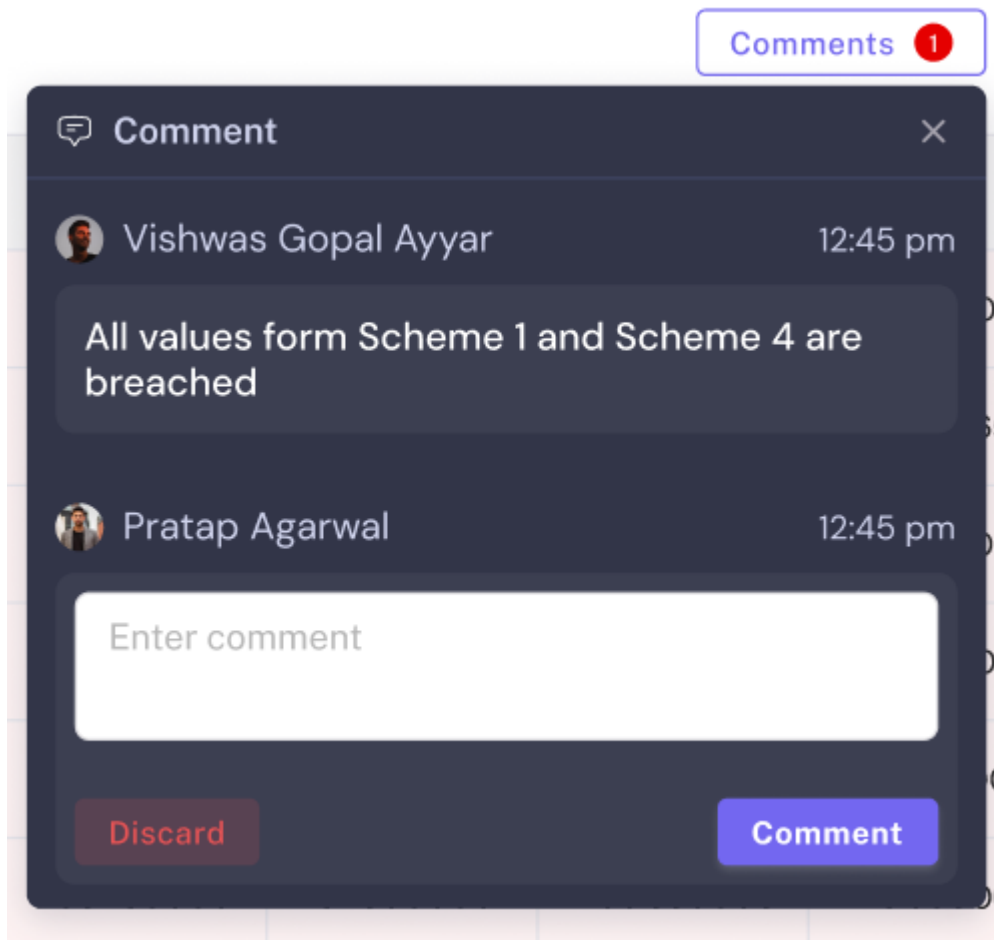

The image displays three vertical panels illustrating the states of a comment component. Each panel has a dark grey background and a white comment card.

- Initial state (top panel):** The comment card shows the 'Current value' as 'The quick brown fox jumps over the lazy dog'. The 'Field label' is 'Placeholder'. The 'Comment' field is empty with a placeholder 'Please provide a reason for the change'. The 'Upload support document' field is empty with a placeholder 'Select a file to upload' and a download icon. At the bottom are 'Discard' and 'Submit Suggestion' buttons.
- Editing state (middle panel):** The 'Current value' and 'Field label' remain the same. The 'Field value' is 'Field value'. The 'Comment' field contains the text 'The quick brown fox jumps over the lazy dog'. The 'Upload support document' field contains the text 'Filename.pdf' and a download icon. At the bottom are 'Discard' and 'Submit Suggestion' buttons.
- Submitted state (bottom panel):** The 'Current value' and 'Field label' remain the same. The 'Comment' field contains the text 'The quick brown fox jumps over the lazy dog'. The 'Supporting document attached' section shows a file icon, the text 'File name.extension' and '23.5MB', and two icons (a document and a download icon). At the bottom are 'Delete Comment' and 'Edit Comment' buttons.

This comment component has three states:

1. **Initial state** – the field is empty and it shows one comment with the *current value*.
2. **Editing state** – the user has typed some data into the form.
3. **Submitted state** – the comment has been submitted.

The comment component should include the functionality shown in the image below.

On clicking the button, the comment box should open as shown in the image.

The close button should properly close the comment box, and the dialog with comments should be scrollable.

NOTE: The design should follow the first image, and the functionality should follow the second image.

Instruction: The component should use Tailwind for styling and TypeScript/JavaScript for functionality.
